Data Engineer with 5+ years building PySpark, Spark and SQL pipelines on Databricks, Snowflake and Azure across supply chain, healthcare, telecom and energy. I move large datasets between platforms and prove every record arrived intact.

| ~10M | 100+ | Days → hours | ~5M / day |
|---|---|---|---|
| records reconciled | attributes checked per record | validation time | billing records ingested |

## EXPERIENCE

**Tredence** · Associate Manager (Data Engineering) — Feb 2026 – Present · Bengaluru

**Supply chain product data migration, legacy MongoDB → new data platform**

- Cut validation from **days to hours** across **~10M records and 100+ attributes** by building PySpark reconciliation pipelines in Databricks that join source and target on business keys and flag mismatches, missing values and duplicates field by field.
- Made cutover sign-off evidence-based, as one of two engineers on the migration, by automating checks to re-run on every load and producing a mismatch report for stakeholders.
- Reduced rework by writing requirement documents and securing stakeholder sign-off before the build started.

**YDI Solutions** · Senior Data Engineer — Jan 2021 – Jan 2026 · Bengaluru

**Healthcare client (via Virtusa) · Snowflake on Azure** — 2024 – Jan 2026

- Delivered analytics-ready healthcare data across **20+ Snowflake tables** by building layered SQL transformations from raw to cleansed to curated.
- Kept **zero data-exposure incidents** on sensitive customer data by applying masking and role-based access to confidential fields at every step.

**AT&T · Telecom billing ingestion · Spark, Airflow, Azure** — 2023 – 2024

- Ingested **~5M billing records a day from 5 source systems** into Azure by building Spark ingestion pipelines.
- Kept **~99% of daily runs on time** by orchestrating pipelines in Apache Airflow with DAG dependencies, retries, SLA alerts and failure notifications.
- Gave reporting teams reliable, queryable billing data by designing the storage layer and data model.

**BP · Global logistics data · Python, Pandas, REST APIs** — Jan 2021 – Apr 2023

- Served global logistics data to **3–4 downstream teams** by building Python REST APIs.
- Saved **about a day of manual data prep every week** by automating extraction and transformation in Pandas, with reusable transform steps so new feeds plugged in without changing the API layer.

## SKILLS

| | |
|---|---|
| **Languages** | Python, SQL, PySpark |
| **Processing** | Apache Spark, Pandas, Delta Lake (Medallion), incremental loads (CDC, watermarks), Spark tuning (partitioning, AQE, joins) |
| **Platforms** | Databricks, Snowflake, Azure (Data Factory, ADLS Gen2, Key Vault), MongoDB |
| **Orchestration** | Apache Airflow, Azure DevOps CI/CD, Git |
| **Data practice** | Data reconciliation and quality, data modelling (star schema, SCD Type 1/2), RBAC and data masking |
| **Currently learning** | Google Cloud (BigQuery, Dataflow), streaming (Event Hubs, Spark Structured Streaming) |

## PROJECT

**Jarvis**, hands-free AI voice assistant for my phone: answers questions and runs scheduled tasks by voice, built end to end with Python and the ChatGPT API. — Dec 2025 – Jan 2026

## EDUCATION

**B.E. Electronics and Communication Engineering**, First class · ER Perumal Manimekalai College of Engineering (Anna University) — 2017 – 2021
